THE WORLDWIDE TV-FM DX ASSOCIATION

Serving the UHF-VHF Enthusiast

THE VHF-UHF DIGEST IS THE OFFICIAL PUBLICATION OF THE WORLDWIDE TV-FM DX ASSOCIATION DEDICATED TO THE OBSERVATION AND STUDY OF THE PROPAGATION OF LONG DISTANCE TELEVISION AND FM BROADCASTING SIGNALS AT VHF AND UHF. WTFDA IS GOVERNED BY A BOARD OF DIRECTORS: DOUG SMITH, GREG CONIGLIO, BRUCE HALL, KEITH MCGINNIS AND MIKE BUGAJ.

Editor and publisher: Mike Bugaj
Treasurer: Keith McGinnis Webmaster: **Tim McVey**
Editorial Staff: Victor Frank, George W. Jensen, Jeff Kruszka
Keith McGinnis, Fred Nordquist, Matt Sittel, Doug Smith,
Adam Rivers and John Zondlo,
Our website: www.anarc.org/wtfda
ANARC Rep: **Jim Thomas**, Back Issues: **Dave Nieman**,
FEBRUARY 2005

Finally! For those of you online with an email address, we now offer a quick, convenient and secure way to join or renew your membership in the WTFDA from our page at:

<http://fmdx.usclargo.com/join.html>

Dues are \$25 if paid to our Paypal account. But of course you can always renew by check or money order for the usual price of just \$24. Either way, it's still a bargain!

VUDS ON A CD!

Every VUD from Jan 1980 to December 1989 is on this disk. You'll need Adobe Reader to read them. Why have a box of old VUDs taking up space when you can have this. **It's yours for just \$8.00 per disk.** Send your check or money order for \$8.00 to WTFDA, P.O. 501, Somersville, CT 06072. Make it payable to Mike Bugaj.

We have another great VUD issue for you. Everybody is here except for JZ's Southern FM column (John had no reports this month).

Peter Baskind begins a new column devoted to 6 meter and 2 meter DX. Those of you who are into DXing these bands, please support it!

Also we have an update on DTV set top boxes and DTV computer cards, plus the latest on FM IBOC. We even have FM Statistics this month! Hope you enjoy this issue!

FEBRUARY 2005

It's February, we're back and we're ready to go. Keep looking for that off-season tropo. I noticed FM tropo into western New York and Ontario on Jan 3rd. Jeff Kruszka and some Midwestern TV DXers noted it on the 8th and snagged some great catches. And Charles Gauthier found tropo to Quebec City on the 12th. Keep looking because sometimes you luck out. Don't give up when the tropo maps look bad. Sometimes they're wrong.

MEMBERS AND MORE

First I'd like to thank everyone who sent in another check payable to me. The money will really help us with publishing this month. As of Jan 15th, I have checks received from **John Reiger, Lenny Goldberg, Ed Norris, Adam Rivers, David Wurl, Les Prus, Rod Thompson, Tom Bryant, Dave Pomeroy, Don Niles, Ted Liszweski, Bruce Elving, Jim Thomas, Glen Hale, Russ Edmunds, Bob Seybold, Mark Casey, Randy Davis, Paul Hansen, Bruce Hall, Dennis Elya, Morris Sorensen and Bernie Higgs**. I also have received three checks for the Mexican FM Log. If you sent a check and I haven't acknowledged it, don't worry about it. If you are reading this and the expiration date on your VUD mailing label is correct, you're fine.

We want to welcome Randy Davis of Jeffersonville, IN back into the club. No sooner did he rejoin than I mailed his check back to him. Some welcome *that* was. And another welcome back to Dennis Elya in Jefferson City, MO. Glad to have you back and DXing again!

If you own a computer, you're familiar with the term "safe mode." Well, right now the club is plodding along in "safe mode" until the club funds can be retrieved and placed into a new account. I spoke to the bank and they advised me to send a signed letter requesting the funds, which I did today. Let's hope we have the financial situation settled by the time you receive the March VUD. We have a new WTFDA TV Station Guide scheduled for this year and the cash will definitely be needed for printing and mailing.

MORE CH-CH-CH-CHANGES!

I need all of you folk out there who are also hams and work 6 meters to raise your hands. Any 2 meter people? Thought so. We do have quite a few hams in the WTFDA.

Many 6 meter hams are also into TV DXing. Both modes go together like tortilla chips and salsa.

So we are going to try something the WTFDA has never tried before. Beginning with this issue, Peter Baskind(TN) will edit a column for all of you folks out there who are working or monitoring 6 meters. Maybe he'll even add 2 meters.

Response to the creation of this column by WTFDA list members was positive. We hope all of you will give it a look and contribute if you are so inclined. Also your feedback would be appreciated. We hope that most WTFDA members can find something interesting in this new column.

MORRIE FOUND US

Morrie Goldman is one of the founders of the WTFDA. Morrie is still around and writes "I gave up on TV DXing years ago when the local channels became so blocked by full power, 24 hour-a-day locals, that it just wasn't worth the struggle. One of these days I should try to sell my old Conrac AV-12E and other gear, if it still has any value.

I think you did a nice job in reporting on Dave and the VUD looks great. I know how much work it involves...boy do I know. It has a nice consistent look.

By the way, in reading Bob Cooper's comments on Dave, one person who should have received credit for helping start WTFDA didn't...Gary Olson. In the beginning, Gary and I pulled together the first mailing lists and mailings to get the club moving. This was at a time when some former AIPAers felt that a new club couldn't survive. Gary was right there when we began publishing and he really invested a lot of time. As time went on, there were many others who helped as well."

It definitely was a treat receiving an email from Morrie. And it was another treat when the following email arrived in my inbox.

This time it was from Gary Olson, who, by the way, is still in the WTFDA and living in Florida. Gary wrote "I was stunned to hear that Dave Janowiak passed away. I first met Dave at the AIPA convention (I think in 1960) at the home of Tom Hidley in Chicago when I was living and DXing in Barrington, Illinois.

When several of us reconstructed the ruins of AIPA into WTFDA in the late 60s Dave was always a big supporter. It was his assistance that helped us move the club to Chicago headquarters where Morrie Goldman and I handled publication and operations for several years. Dave, Bruce Elving (while in Milwaukee), and Don Ruland (who I have lost track of) helped keep the bulletin going out as Morrie and I made the transition to offset printing which represented a monumental change for WTFDA.

Dave wrote a multipage treatise for me on his struggles to erect a new TV tower from scratch which guided me step by step to build my own on my roof in Deerfield, Illinois. He hand built a JFET amplifier for me which I used in my DXing in Deerfield and at my later home in Lake Forest, Illinois.

After a very painful divorce he pursued a diversity of interests including guiding the fortunes of cable TV in his community of Greenfield, Wisconsin. I last saw Dave about 10 years ago when I sold my TV tower, Conrac Tuner, UHF dish antenna and other items in preparation for my retirement move to Florida. He came to my home with a large truck and picked up all the metal and we had a chance to talk about a lot of things. He was really a nice guy. We will miss him."

By the way, Morrie is no longer in the club but he will receive this VUD in electronic form. It's great to hear from the club's founders, although we all wish it had been done under happier conditions.

TV STATION GUIDES SOLD OUT

All of last edition's WTFDA TV Station Guides are sold out. Please do not send any checks or requests or inquiries to John Ebeling. John will have to return any checks he receives. Hold on to your wallets because the 2005 TV Station Guide is in the works. We'll let you know how it's progressing.

RECORDING DX ON YOUR COMPUTER

Russ Edmunds helps to sort out all the options available. Here we go: "During the past week we've had a lot of discussion here (and a lot more offline) about recording software and visual displays of the waveforms of the recorded segments. While I was unsuccessful at having any Ms here, I did manage to find one recording where there was some short range tropo-scatter, which was immediately evident on viewing the

waveform, and therefore easy to go right to that point and listen.

We've talked about several pieces of software, and I've taken the time to run that troposcatter file through all of them. Here's my mini-review of those:

1) CoolEdit 2000 (or Pro) [now known as Adobe Audition] - By far has the most functionality but is also by far the highest cost. Takes forever and a day to load and read in a sizable .mp3 file. Good size, clarity and resolution on the visual display. This is professional audio software and as such it is very complex and requires a big learning curve. It can also record and do scheduled recordings and offers different types of views.

2) Total Recorder Professional Edition v 5.0 - This is very inexpensive software on a relative scale. I've used Total Recorder Standard Edition for all of my recording for over 18 months and been very satisfied. The Pro edition has a "sound image feature" to view the entire recording, however the viewing area is small, and the display is neither as clear as any of the others. TR also has fewer options for manipulating recordings - does not have a 'stretch' option. It does have a good scheduler, and the recent v.5.0 upgrade for both editions now has options for a graphic equalizer and spectrum analyzer at no extra cost.

3) The Amazing Slow Downer - This is a piece of Scandinavian software which was designed for use by musicians, however it does have graphic equalizer, stretch, and tone/pitch control independent of the stretch.compress function. It doesn't record, and while it will read .mp3's, it won't save in that format. No visual display. Inexpensive.

4) Power MP3 Editor Pro 2005 - This is, IMHO, the best of the lot on balance. It has a separate recorder software that comes along with it, loads an .mp3 in less than half the time required for Cool Edit, and can take the visual display to nearly full screen. It has all of the functions you'd need and then some, but isn't as robust as Cool Edit, nor is it as complicated. Best yet, the price/value equation simply can't be beaten.

I'll be sending in my \$\$ for Power MP3 Editor shortly. I'll experiment to see which I like better for the actual recording, their recorder or my existing Total Recorder Standard.

Of course I did not include what is probably the premiere audio editing software out there, Sound Forge, as I have no experience whatsoever with it."

LAST BUT NOT...

WTFDA membership is up to 268 as of January 22nd. Have a good month and we'll see you next time. -Mike

Thanks to Bob Delaney, Calvin Means, Calvin Glover Jr., and David Austin for information appearing elsewhere in this month's column...

Bob says KUMO-LP 51 is not off as we reported last month. They're carrying something called "Lick TV". (?! - Bob questioned the accuracy of his observation, but a search on Google confirms the name!) This is parallel to WPXS-13 Mt. Vernon, Illinois, just as when the stations were Pax affiliates. Speculation is that channel 51 will soon go Univision.

Calvin Means is associated with a group of LPTVs in the northwest Georgia/Chattanooga area. He forwarded programming updates on his stations. Their main outlet is WDNN-CA channel 49 in Dalton, Georgia, which carries FamilyNet and local programs. This station is relayed by WRNG-LP (ch. 63 w/CP for ch. 28) Ringgold, WLFW-LP ch. 41 Lafayette, and WSUT-LP ch. 21 Summerville.

WTNB-CA channel 27 in Cleveland, Tennessee also carries FamilyNet and local programs, but the local programs are different from those aired on WDNN and relays.

Finally, WDGA-CA channel 43 in Dalton has gone Spanish, with the Azteca America network.

Our other Calvin this week reports from the North Carolina Outer Banks. He's noted new LPTVs W17CT and W28CJ testing. They're running a test pattern with IDs for both stations, mentioning Nags Head as the location. The stations are actually licensed to Manteo. The tests were alternating – after W28CJ was on for awhile, it disappeared and channel 17 showed up.

Another Manteo LPTV is no more. WMTO-LP channel 6 has been off the air for at least a year. If the FCC finds out, the dark period will become permanent: the Communications Act requires the Commission to revoke the license of any station that remains off for that long.

Finally, David notes the premiere of new station WZRB-47 in Columbia, South Carolina. When seen it was airing a loop of promotions for the programs the station will air when regular broadcasts begin. WZRB is to be a UPN affiliate.

The two Mexican changes may have taken place some time ago. They were noted when updating my Mexican database for the upcoming Station Guide. There have been a number of less-dramatic changes in Mexico but these two will definitely affect one's Es DXing.

It's been a slow month at the FCC. The holidays slowed things considerably. They've also been dealing with a large collection of FM applications after the largest auction of FM channels ever.

Good DX!

THIS MONTH'S COVER

Please, do not turn your head 90 degrees to view the cover. Turn the VUD 90 degrees instead. This pretty picture was sent to us by Roy Barstow, who not only Dxes the TV bands, he takes some mean pictures!

"What do you mean...it doesn't snow on Cape Cod? Yeah, we only play winter golf." But you don't play golf in 14 inches of snow. Guaranteed.

ABBREVIATIONS:

AF: applied for (a new station)
AFA: American Family Association
CC: call letter change
CL: city of license change
CX: a construction permit has been cancelled
C1, C2, etc.: a change in status to that FM license class
DA: directional antenna
DE: station has been deleted
FC: format change
GA: granted amendment to the table of FM allocations
GE: granted extension of construction permit
GX: granted replacement of expired permit
LC: license to cover filed (ready to come on the air)
MC: multiple-city ID
NC: no change yet on a reported change or permit
ND: non directional antenna
NO: not on the air
NS: new station granted

NW: new station signs on
OSA: one step application granted for change
PA: proposed amendment change to FM allocation table
PC: power change on the air (> = increase, < = decrease)
PG: power change granted (> = increase, < = decrease)
PR: power change requested
QC: frequency changed occurred
QG: frequency change granted
QR: channel change requested
RA: silent stations returns to the air
RE: station requests an extension on permit
RX: station requests replacement of expired permit
SC: slogan change or update
SI: station is silent
SOA: signed on air
XA: dismissed amendment to FM allocations
XC: transmitter site change occurred
XG: transmitter site change granted

Eastern TV-DX

Matthew C. Sittel
15013 Eureux St.
Bellevue, NE 68123
mcsittel@cox.net

February, 2005

Mar. 2005 column deadline: Feb. 12

Eastern TV-DX is for reporters from the following states: AL, CT, DE, FL, GA, IN, KY, MA, MD, ME, MI, NC, NH, NJ, NY, OH, PA, RI, SC, TN, VA, VT and WV, plus Washington, DC. Also for reporters from the following Canadian provinces: NB, NF, NS, ON, PEI and PQ. Overseas reports welcome!

There's not too much DX to report this time; one of these reports was held over from last month. Hopefully conditions will improve!

John Vervoort, 102 Northside Drive, Unit 2D, Madisonville, KY 42431-6158

Equipment: 2003 Toshiba 13A23, 2002 Sharp DV-NC55U VCR/DVD, Radio Shack 15-1244A RF modulator, Radio Shack 15-1838 amplified indoor antenna.

No real long-haul tropo on FM or TV this year, and the good Es was relegated to a few great days in early July. Here's hoping for a productive 2005 season! 73s, Saul

There seems to have been a fair amount of Es activity this winter season. I have been busy and have not been checking all that often. The 11/26 opening was a surprise, being at 11:30 at night and got up to at least 104 MHz. It didn't last long, however.

Picking up CIVA1-8 via MS has whetted my appetite for meteor scatter. Here on Cape Cod the tropo lingers on, much like the tourists here.

A man for all seasons for the love of DXing I am. When the leaves are all down and snow covers the ground, and the tourists have left old Cape Cod, that's when I fire up the VCRs in hopes of receiving new distant stations.

Helpful hint: if you submit your report to me using Microsoft Word (or in another electronic format, such as WordPad), please tab delimit each field, and follow the reporting format seen in the above reports. This will speed up preparation of the column, as I can use it "as-is" with a minimum of reformatting and retyping. Thanks in advance for your cooperation!

That's all for this month. If you've been seeing some off-season skip or didn't report your summer and fall catches, now's as good a time as any to report! Help fill the pages of the VUD with the wholesome goodness of DX reports! 73s Matt.

WOODSIDE, CA 94062-4554
Victor.frank@sri.com

Dennis Park Smith, 3605 San Remo Drive, Santa Barbara, CA 931105-2523 (805)687-7803

This report is for November 2004. Southern-California coastal tropo (to San Diego/Tijuana, up to 200 mi—320 km) was mediocre, typical for this time of the year with mostly unsettled weather to keep the atmosphere stirred up and unstratified.

Nov 1-2am: None (Cont'd from Oct 15-31)
Nov 2 eve-3am: Fair
Nov 3 eve-14: None (Occ. Rain Nov 4-13).
Nov 15-16: Poor
Nov 17: Fair
Nov 18-19am: Good
Nov 19 eve: Poor
Nov 20-22: None (Unsettled, stormy nearby)
Nov 23-24: Very poor
Nov 25: Poor
Nov 26-30: None (Stable but colder)

I made a quick trip to Wasco Nov 26 eve-27 a.m., where I found another new local. KVVG-LP 31 Porterville (Almavision Hispanic Network)(near local, possibly 40 mi) was new in July, and low-power 31 Bakersfield (Telefutura)(possibly 35 mi) was new this time, as quite a strong local, overtaking KVVG. The two Ch. 31s may be no more than 50 miles apart. The new Ch. 31 Bakersfield is evidently a channel change for LP 52 Bakersfield (presently simulcast on both channels) except for a bottom-screen crawler on Ch. 52 only, which said in English and Spanish, "Telefutura is now on channel 31. Please tune to channel 31 now for Telefutura." Ch. 31 has quite a stronger signal than Ch. 52. There was a 3-way ID for Chs. 31/52 (same call letters for both channels in this apparent transition) and LP Ch. 4 Telefutura Bakersfield, but I forgot to make note of the letters.

I had a great visit with Bob Cooper in Bakersfield on the afternoon of November 27, as he was making a quick trip through California. I haven't actually seen him since perhaps 1961 when he lived in California.

This report is for December 2004. The coastal tropo to San Diego/Tijuana (200mi/320km) was poor most of the time, typical for this time of the year.

Dec 1-2: None (Stable but cold since Nov 26)
Dec 3-9: None (Unsettled, Occ. Rain Dec 3-8)
Dec 10: Very poor (Stable, slightly warmer)
Dec 11: Poor
Dec 12: Fair (Perhaps low inversion layer in this early part of a stable cycle?)
Dec 13: Poor
Dec 14-18 am: Very poor

Dec 18 eve: Improved to poor
Dec 19: Fair
Dec 20: Poor
Dec 21-24: Very poor
Dec 25: Fair to good
Dec 26 am: Poor, deteriorating
Dec 26 eve-31: None Unsettled; rainy into January

Best of DX to All, Dennis

Mike Cherry, VE7SKA, Salt Spring Is., BC CANADA

logging by 60 miles. No other stations short of Madison were seen; most of the dial was empty!

2. My most wanted skip logging-I wasn't sure I'd ever get it. Local newscast with Maine politician mention, later faded up enough to make out logo in LR.
3. I have no idea why this took 5+ years to log here... it wasn't for lack of checking!

Fall tropo started out with great promise, but ended up being a dud. There were some exciting moments in August and September, with a few new loggings. A little off-season skip in December was nice, although it tended to be very short-lived (on the order of 10 minutes) and thus IDs were few and far between. Log totals now stand at 786, which includes 129 DTVs. 73s Matt.

COLUMN DEFINITIONS:
Total = Total number of FM stations logged from DXer's location.
(All loggings should be received within 25 mile radius of this location to count.)
Freq. changes count as a station, call letter changes DO NOT count.
Also count a station only once regardless if logged by different propagation modes. 88-92 = All stations logged from 88.0 to 91.99 Mhz.
LPFM=Total LPFM/Translators Es = Total number of stations logged via E-skip .MS = Total by meteor scatter.
Au = Total via Aurora. USA = Total number of states and the "*" = Washington, DC.
CN = Number of Canadian provinces logged. MX = Number of Mexican states logged.
FO = Number of foreign countries, but not Canada or Mexico. TPU (Total number of political units) = Sum of USA CN MX and FO.
YB = The year you began DXing from this location.
AS OF DATE = Date of last update (Only those who sent updates in Y2K and beyond are listed)

Notes: Updates to your statistics for FM & TV Scoreboards are needed.
This also includes any distance records, States Stats, & Personal Best Records. Please email me for a time saving template if needed.
A current/complete database of existing records and their formats can be found at : <http://home.twcny.rr.com/nordquistsyrl/>
WTFDA guidelines for counting stations can be found at: http://fmarc.org/wtfda/records_standards.html

Now for an odd reception: During the Es opening, a station on 89.1 was heard with an RDS call of "WLLJ". WLLJ is on 103.1 in Etowah, TN. So far, I have been unable to pin down the 89.1 station which was probably a xltr. No answer from WLLJ as I type this. Suppose an xltr picking up a wrong primary station due to the Es??. Makes for an interesting theory, anyway.

6 Meter/2 Meter Amateur DX

Peter Baskind, N4LI
3225 Forest Hill-Irene Rd
Germantown, TN 38138
N4LI@ARRL.net

Welcome to a new addition to the VUD – a column dedicated to VHF Amateur DX, with an emphasis on the 50 Mhz 6 meter band.

While there has been much discussion on the e-mail group lately about a possible addition like this, there may be some in the Club who are not familiar with 6 meter DX, or how it might pertain to the pursuit of TV/FM DX. For that reason, the next few months will contain some basic information on the subject – a primer, if you will – to lay the foundation for what will hopefully be a welcome new feature of the newsletter.

6 Meters for the TV/FM DXer, Part I.

I. Let's Start With the Basics.

The 6 meter band is a large chunk of spectrum, located from 50 Mhz to 54 Mhz, dedicated to the Amateur Radio Service. It is open for use exclusively by those holding a Technician Class or higher Amateur Radio license. On this band, lying just below TV Channel 2, is an interesting mix of transmission modes, users, and propagation.

Many hams enjoy or are even obsessed with this band (I think you can include me here), while some never use it at all. 6 meter's lure is the challenge. Unlike the ham bands below 30 Mhz that may be open everyday, 6 meters is much more fickle. Days or even weeks might pass before any significant opening breaks the near-constant static that most often greets 6 meter regulars. Yet, when the big opening does come, 6 meters may be packed with dozens of signals side by side from the bottom of the band up.

The good news for the TV DXer is that he has a great advantage when it comes to the 6 meter learning curve. Since the band is just below TV broadcast, an experienced TV DXer will already have a decent feel for how the band works. As goes channel 2, so goes 6 meters. But, as we will see, the opposite is not always true.

II. How is 6m Like TV DX?

Since 6 meters is so close to low-band VHF TV Broadcast, every phenomenon that affects Channel 2 also affects 6m. The vast majority of long-distant contacts on 6 meters are made via Sporadic E (E_s). Anytime that Channel 2 is hopping, one can be sure that something is happening on 6 meters.

E_s on 6 meters brings pretty much what a seasoned TV DXer might expect – loud signals most often from distances of 500 to 1400 miles. Like low-band TV, the signals on 6 meters can be quite stable indeed with long periods of easy contacts, punctuated by the deep fades we all know from our TV E_s . The signals can be so strong, in fact, that power levels low enough to still surprise me after years on the band can bring an easy contact. Many times I have made those contacts (Hams call these “armchair contacts”) with as little as 100mw. Yet, when the band is not open 1000 watts is of little help.

6 meter's proximity to Channel 2 makes it very useful is alerting TV DXers to possible openings on TV. As the Maximum Useable Frequency (“MUF”) rises, it passes through 6 meters before impacting TV. Signals heard on this band, then, may pop up just before TV opens, making it a useful tool for those awaiting channel 2 E_s .

Use of meteor scatter is becoming more popular on 6 meters. Hard Core users of the “rocks” are using high-speed computer language to make maximum use of the short bursts that pop up everyday. Operators might make schedules to attempt these contacts.

Tropospheric ducting does occur on 6 meters, as it does on TV. But, like Channel 2, 6 meters is not prone to huge tropo contacts like the higher frequencies might be. Typically, VHF DXers will not spend much time chasing tropo on 6; they’ll concentrate on 2 meters or higher for long-haul tropo contacts.

Like TV/FM, aurora occasionally impacts 6 meters. While most operators use CW on aurora, occasional contacts can be made via voice.

III. How is 6 meter DX Different From TV DX?

6 meters is often called “The Magic Band” by those familiar with it. Once you have spent time on six, you soon learn why... it’s a band on which almost anything can happen!

A. Double-Hop

While E_s is 6 meter’s main attraction, what one gets on six via E is a bit less limited than on TV. Double-hop E, the holy grail of the TV DXer, is not uncommon on 6 meters. Guys like me, situated in the South, can expect to work the entire Continental United States with a little help from double-hop. It is about 2000 miles from my home in metro-Memphis to Seattle, a seemingly impossible distance for TV DX, except on the rarest of occasions. On six, however, I can expect to hear Seattle, or Portland, or Vancouver a few times a year. California, a state no less than 1400 miles from here, comes in fairly often. There are a few operators in Los Angeles that I have even come to know by their first names.

The possibility of double-hop E gives the 6m aficionado opportunities for countries not ordinarily available for the TV DXer. From my home, the Caribbean is workable perhaps a few times a year on the band, allowing contacts to places like Puerto Rico, Colombia, and the Dominican Republic. Countries without high-power low-band VHF TV are also sometimes available. On very rare occasions, DXers in the middle part of the country might even hear Europe via triple-hop or quadruple-hop E_s .

The possibility of these multi-hop contacts gives the seasoned TV DXer much to think about. If 6 meter signals double-hop, should not Channel 2 do so too? The answer is both yes and no. Although big openings can bring many signals and interference, the path across the country is simply less crowded on 6 meters than on Channel 2. 6 meters is a big band, so the frequency on which a double-hop contact is being made might be clear enough of the stronger single-hop contacts to be heard clearly. This is not the case on TV. But, a strong double-hop opening on 6 meters may HINT of the possibility on TV. I specifically remember a strong 6 meter opening from Memphis to Los Angeles a couple of years back in which Guy Westerberg in Kentucky snagged KCBS-2. So, again, 6 meters hints of the possibilities on TV.

B. F2 on 6 meters

Ah, F2... the much talked about, but rarely seen propagation mode on TV. We have all heard of and read about those rare, distorted, flickering images on Channel 2 from two thousand or more miles away brought about by that maybe once-in-a-lifetime F2 opening. A lucky few saw intercontinental F2 in December, 2001, and even fewer caught a glimpse in October, 2003. Yet, those of us on the 6 meter band know the elusive F2 opening well.

There are only a few megahertz between the top of the 6 meter band and Channel 2 video, but that seemingly small gap makes a huge difference. MUF on F2 is much less agile than with E_s . To move even a few megahertz can be tough. But, conversely, the fact that 6 meters is below Channel 2 makes F2 on six more common.

The Fall and Winter of 2001/2002, just a few months after I got my ham license, were very active for 6m F2. Many mornings that Fall and Winter, I was treated to sometimes very strong signals from Europe, the Caribbean, and other exotic locales. Afternoons would often bring in Alaska for sometimes a couple of hours. It was fun; but I had no idea how great I had it. Countries I have little hope of getting via E_s were so strong, I could probably have worked them with a coat

hanger for an antenna. But, what a difference a few years make. Now, with the Solar Cycle approaching bottom, F2 is almost unheard of on 6 meters. Something very unusual – like a big solar storm – would be needed to wake up that higher altitude ionospheric layer for the Magic Band.

As with E_s, 6 meters can provide an early warning of possible TV F2. Particularly intense openings may imply something might be afoot a few Mhz up. Similarly, strong 6 meter F2 can help explain unidentified signals seen on TV. WTFDA members may remember unidentified F2 seen in Shreveport and South Texas in 2003. While the DXers were never able to get quite enough identifiable information to positively log, I remain convinced it was Hawaii – a nearly 4000 mile reception -- those lucky two were getting as an historic 6 meter F2 opening to the islands was well underway at the time. Many 6 meter operators – including me – got their only 50 Mhz contacts into Hawaii thanks to that surprise opening.

C. Transmission Modes.

The vast majority of activity on the Magic Band is Single Sideband voice (SSB) and CW (Continuous Wave Morse Code). Look for most of this toward the bottom of the band. 50.00 to 50.1 is exclusively CW, while most domestic SSB is found from 50.125 and up. Exotic DX is often centered in “the DX window” between 50.1 and 50.125.

There is some limited FM activity on 6 meters. While FM is significantly less efficient than SSB, its ease of operation and better sound quality attract some users. Most FM activity will be around 52.525 during band openings. I particularly like FM DX while in my car; I have found operating SSB to be a bit distracting in traffic. Still, with just my FM-only 50 watt mobile (I use a Yaesu FT-8900 in my car), I have made many contacts in the 400 to 1200 mile range.

There is a smattering of FM repeaters on six. While repeaters on 6 meters are significantly less common than on 2 meters or even 440 Mhz, many towns can boast a repeater on six. Here is Memphis, for instance, we have a very nice machine on 53.01. We have a local information net on Wednesdays, and recently had a check-in from Canada during a sporadic E opening. On 6 meters, you never know what you might hear!

AM attracts a small but loyal following on 6 meters, too. During intense openings, look for signals around 50.400. I have chatted with some very active AM operators in North Carolina, and just had a ball doing it.

D. Grid Squares.

Many 6 meter operators engage in an activity unique to VHF DX – Grid Square hunting. The *Maidenhead Locator System* divides up the entire world into many “squares,” measured by one degree of latitude and two degrees of longitude. These squares are designated by a two-letter, two-number identifier (I live in EM55, for example). Various awards are available for working squares, most notably the American Radio Relay League’s VUCC (VHF/UHF Century Club) for working and confirming by QSL 100 or more grids.

The United States alone has literally hundreds of targets for the active 6 meter operator. Even the most seasoned 6 meter fan will always have a rare grid or two that he still needs. Fortunately, other 6 meter operators will often operate portable in these rare, sparsely populated grids so folks like me can finally get them in the log.

There are many grid maps available on the Internet. Perhaps the best is a full color downloadable map made available by Icom, a manufacturer of ham gear. Go to <http://www.icomamerica.com/downloads/usgridsq.pdf>

End of Part I

In the coming months, we’ll discuss other important issues about 6 meters and VHF Ham. Topics will include how to get started, equipment questions, the art and science of QSLing, and the like.

Of course, we will also be looking for your loggings. Please feel free to send them anytime to the address listed above, or my Yahoo! account, ag4ki@yahoo.com.

Loggings

Peter Baskind, N4LI. 3225 Forest Hill-Irene, Germantown, TN 38138. EM55

As I write these loggings, it appears that the short Winter E_s Season has all but ended. It was a bit disappointing this year – openings were less intense than previous years, and only two new squares were worked. In short, it's slim pickings. Still, it's always fun to work the band, and I enjoyed what openings we had.

Loggings below will follow a format I hope to make standard. Listed will be the worked station's callsign, their grid, state, and any other pertinent information.

All times UTC; all 6m E_s.

Worked with ~4 watts

28 Dec. '04

2022 KØMVJ EN36/MN
2032 W5CIA EM40/LA [note 1]
2131-2358 More contacts to MN. Also worked KØDLW DN76/ND at 4 watts for my first 6m ND contact below 5 watts. Arizona also worked.

29 Dec. '04

2222-2258 Many contacts into CT, MA, PA, NY, RI, etc. A couple CO stations also popped in. Nice opening.

30 Dec. '04

0003-0056 Very nice opening with numerous contacts into OH, PA, NY, etc. Far too many contacts to Ontario to list. Those VE3s were stacked pretty high. Highlight of the opening was VE2XK **FN07**/PQ for a new grid at 0037.

[note 1] I am not quite sure of the mode in the W5CIA contact. After both W5CIA and I had worked the Minnesota station, W5CIA asked the operator to ask me to attempt to contact him in Louisiana. After moving to a new frequency, we were barely able to hear one another. The contact was very weak and watery, making one wonder if it was troposcatter or backscatter. Interestingly, there was a very strong meteor burn mid-contact which brought W5CIA up to S9 for about ½ second.

I am KC9BQA -- Todd Sprinkmann up in EN63ao, 40 miles north of Milwaukee. I got on the air a year and a half ago, after being an on-again, off-again SWL/scanner/BCB/TV/FM DXer. My wife and I moved to a radio-friendly location in the summer of 2003, and that released a lot of pent-up radio dreams in me, LOL.

I've been lurking [on the e-mail] list but not really doing any FM dxing yet. I spent a lot of time getting the V/UHF contest station on the air. So anyway... I spend a lot of time monitoring 50mhz and I have a 5el M2 beam up @100'. When I send you 6m logs, I will try to focus on simply DX.

I was amazed to see all the interest in 6m that came out here on the list. I hope this is something that can be nurtured and expanded upon. I plan on doing my part, and as this evolves, I may have some resources to share with the list. For now, I'll keep it fairly short and get to my Jan. loggings.

[note 1] NEW STATE! KS is #45 for me on 6. Still need WV/SD/OR/AK/HW.

[note 2] This is fairly short skip on E's for me. Figured FM band must be pretty good.

[note 3] E's to southwest shut down but I kept hearing W2DAN. Never anyone else -- odd.

METEOR SCATTER GUIDE

Maps By Jim Thomas

Outside of a few dates in early February averaging 30 hits an hour, the month of February is pretty much flatlined. This is *not* to say that there's no meteor DX in the month of February because there are always random meteor hits. All it means is that we're in a quiet cycle for the near future. And as usual the best time to try is early mornings before sunrise.

TELEVISION: THE TECHNOLOGY THAT CHANGED OUR LIVES

BOB COOPER
PART FIVE

The following material is from an in process book by Robert B Cooper who retains the copyright to this material. None of this may be reproduced in any form without the permission of the author; special permission for VUD to publish this 'draft version' is on record."

Brown, RCA and the industry could be excused for being confused by the FCC's stance. Radio-Craft for September 1948 reported:

"TV allocations will have a profound effect on broadcasters and receiver owners, said John A. Willoughby, acting FCC chief engineer. Mr Willoughby said the lower end of the present television band (channels 1-6) may be wiped out in two years, to make room for fixed and mobile services which require the space. Channels 7 - 13 will be used for TV for perhaps ten years, but only for 'low definition' transmission. The area above 500 mc will be used for high-definition, black and white and color transmissions, which may come in two years. According to Mr Willoughby, a television station starting operation on a low frequency channel in the next two years is faced with possible loss of its transmitter and antenna investment. It follows that receiver owners would also take some loss, even if only that required to purchase conversion units."

The 1947 problems relating to interference between stations and channels was but the tip of the iceberg. With only 18 TV stations actually on the air at the end of 1947, the start-up of 15 new, additional, TV stations during the first half of 1948 would drive the Commission's engineers up a wall. Each new operating station further muddied the waters and while on one hand the new service areas opened up for the first time (such as Dayton and Richmond) meant millions of new homes were being exposed to first time local TV, on the other hand the additional transmitters were adding to the "pollution" of the channel space.

RCA apparently had mixed feelings about UHF, mostly dominated by a certainty that if the FCC rushed into use of the "ultra highs" without a foundation of wave propagation knowledge it would be, as Brown so aptly recorded, "a disaster." The logic underlying what RCA did next is difficult to comprehend.

Brown: "During the summer of 1948 a UHF transmitting antenna was constructed and mounted above the WNBW turnstyle (Washington, DC). Frequency converters (UHF to VHF) were designed and went into

selected homes in the Washington area, 75 in number. We experienced many failures of the UHF (504-510 mc) picture transmitter since we were using a transmitter tube designed for the VHF band and were pushing the tube to the limit in order to operate in the UHF band. A panel truck with an awesome assemblage of measuring gear and television sets began a thorough comparison of UHF service in the area rendered by WNBW on channel four. We gathered a mass of data concerning everything we learned in Washington and assembled it in a thick document called 'The Washington Field Test'."

Of course some (read - many) of the 75 locations receiving test UHF antennas and converters were folks employed by the FCC. Not a few others were influential people in the television business, such as Sol Taishoff the editor and publisher of the industry's trade magazine Broadcasting. RCA was walking the most delicate of lines here. Intuitively, they wanted UHF to work. But more than that, they wanted the handful of influential folks centered in and around Washington to realize that a serious UHF effort was not a cake walk and there were so many unknowns that a premature move to UHF was - well, just as bad as a premature move to color.

That "delicate line" is best illustrated by an incident during November 1948. After a summer of testing in Washington, and reams of collected data, the Institute of Radio Engineers invited George Brown to report on The Washington Field Test. Brown, with the virtually unlimited resources of RCA, conceptualized a one hour demonstration built around use of the 500 mc test transmitter and a second transmitter created especially for the occasion operating at 850 mc. He planned to use the 850 mc transmitter, fed from the extensive production center at WNBW, a staff announcer from NBC, and the 500 mc transmitter to create a parallel set of transmissions which would be displayed on 8 RCA television receivers on a stage at the auditorium of the Potomac Electric Company. There was a full scale dress rehearsal on the afternoon of the demonstration and everything worked fine. The 850 mc transmitter was only video, relying on the 500 mc field test transmitter for the audio while graphs and charts and

photographs flashed on the 850 mc receiver screens. Brown, describing the evening of the presentation:

"While we were dining preceding the demonstration, a phone call from the transmitter room. The 500 mc picture transmitter had given up the ghost. Mildly disturbing, of course, but not enough to really excite us. We rose to the occasion and decided to transmit the picture portion on our 850 megacycle marvel and receive the sound from the (still functional) 500 megacycle sound transmitter. Just two minutes before the appointed time for the broadcast, I was again called to the telephone. 'This is Archie at the transmitter. The sound transmitter just conked out'."

Meetings of the IRE attracted the best of the best in telecommunications. An IRE meeting in Washington attracted the very best of the best, the folks who by their credentials could make or break a new concept merely by the position of a raised or lowered eyebrow. Brown and RCA participants in the IRE had their own pecking-order status within the IRE and it was all on the line.

"I hastened back to the auditorium just in time to see curtains open on eight receiver screens, followed by an NBC announcer who silently moved his lips. I did the only thing possible short of quietly leaving the hall and going to bed. For one hour and 30 minutes, not one hour as my colleagues planned and as the rehearsal ran, in the WNBW studio they held up antennas, pointed at charts, showed slides and gestured violently to make a point while I stood on the stage and supplied sound for the program. Fortunately nobody advised the fellows in the studio they were taking part in a soundless broadcast or it would have been difficult for them to carry on so well."

The FCC on September 30, 1948 came to a reasoned conclusion. Radio Craft reported:

"Television grants were halted by the FCC for a six month period. During this time no action will be taken on applications for (new) TV station licenses. In announcing the freeze, Wayne Coy, FCC Chairman, said that evidence presented at an industry commission conference held in Washington September 13 and 14 raised serious questions about the present and proposed frequency allocation scheme. An engineering conference will be called to discuss the question; meantime, no further allocations will be made.

"Operation of the 37 stations now on the air and construction permits previously

authorized will remain unaffected. Mr. Coy emphasized the usefulness of presently owned and marketed television receivers will not be impaired."

In fact, six months would turn into just short of four years and during that time (through mid-1952) all TV growth would be limited to the reach of 108 TV stations which had received construction permits before mid-September 1948. What perhaps should have been a six to twelve month "freeze" on new applications was about to become hopelessly complicated as the industry and Commission wrestled not only with juggling TV channels about, but also with adding new UHF channels and color. The color question was still a roadblock to the ultimate fabric of television in America.

CBS's Goldmark found a temporary shelter for his field sequential color system through the American Medical Association. It was an unusual marriage. Joseph DuBarry, an assistant to the President for Philadelphia based Smith, Kline and French Laboratories, would be given credit for the concept. It was simple enough.

Television cameras in an operating theater, microphones inside of surgeon's surgical masks, a string of closed circuit TV monitors allowing medical students and practicing doctors to "be up close and intimate" with the skilled hands of the doctors performing the operation. Attempts dating back to 1946, using black and white equipment, had been only partially satisfactory because like the orange and purple flowers side by side in a vase, anything and everything covered in blood had the same grey texture on the screen.

Color was a possible answer. All involved agreed televising intricate operations for medical personnel was a goer, but only if those watching could distinguish between an artery and a scalpel.

Goldmark created a test system which he displayed to DuBarry and a small select group of surgeons including Dr Isador S. Ravdin of the University of Pennsylvania. The demonstration was done using a Japanese manufactured full-sized plastic dummy of a woman's torso, complete down to the inner organs which were only revealed after the quasi-doctors acting out the operation cut through the human colored skin.

Dr Ravdin, according to Goldmark, "immediately ordered a set-up for the university hospital. We devised a small camera on a long beam that could be lowered over the patient on the operating table by remote control, so as to not interfere with the

surgeon. Zenith quickly built us a receiver (monitor) with a 12 inch picture tube and (magnifying) lens. One nice thing I later learned was that coming to us (CBS), that locked out RCA with whom they had been negotiating a black and white camera (system).

"The climax of our (CBS) medical television experiments came in December, 1948 during the American Medical Association's annual meeting in Atlantic City. Zenith built twenty color receivers financed by Smith, Kline and French. We set up the equipment in the operating rooms of the Atlantic City Hospital and ran 'shows' piped to 15,000 doctors in sections of the convention hall. The operations were so realistic on the TV screens that some of the viewers, including doctors, fainted in front of the television screens. (As a result) of the accolades, morale at the (CBS) lab picked up and we actually thought we might sell cameras."

But there was no dissecting the mind of Chairman Paley. Upon his return from the highly successful Atlantic City demonstration, Goldmark received a call from the Chairman's right hand man.

"Bad news, I'm afraid. The chairman has decided he has no further use for the lab. He'll give you thirty days to shut down - and lay off the staff."

It was December 1948. The "temporary freeze" on FCC granting new TV application construction permits was now 3 months old. The number of TV stations operating, those fortunate enough to have been granted a construction permit before the freeze was announced, was now 44 and the number of TV receivers in consumer hands was passing 1,000,000, growing at a rate in excess of 130,000 monthly. Not one of these could receive color.

Peter Goldmark had been told to wind up CBS Labs. Chairman Paley gave him 30 days, he negotiated 90 and then in an act of desperation did nothing to start the process of closing up.

"(in an air of depression) I suddenly remembered that in Atlantic City during the medical convention several members of the FCC had come up to me and bemoaned the unhappy fate of color broadcasting. I was surprised to learn at the time that color had more support than I realized despite the commission's decision against it in 1947. This set me to thinking that if CBS brought color back to VHF, as they had before the war, instead of the more controversial UHF band, the FCC might possibly urge me to come

back to them with another proposal for a license."

And Goldmark's key revelation from Maverick Inventor:

"In a flash it occurred to me that by a simple mathematical transformation of the video signal, I could put color into the VHF band and make it sharp and even greater clarity than before. The net result after a month of weight-losing, intensive concentration, and frenetic activity was the development of a new method of broadcasting color in the low frequencies and at the same time making the image crisper than it had been. We called the sharpening process 'crispensing'. What we did was to electronically enhance the signal to emphasize the image sharpness over the rest of the information carried in the signal. It worked well."

Well enough that, for the third time in his life, Goldmark was able to attract the approval of CBS Chairman Paley. Quite by coincidence, it went through Paley's protégé Stanton and then to the Chairman only hours after a delegation of US Senators had visited with the big man to urge that CBS "do more with the color system shown at the AMA convention." Paley was known for his "love and hate" snap decisions and for the third time in his charmed life, Goldmark through Stanton reached the man at a peak of "love."

The next stop of Goldmark and Co was a private demonstration for FCC Chairman Coy and fellow commissioners. Goldmark reports:

"The demonstrations were so good that CBS took out full-page ads announcing color shows for the public in Washington. The reaction was very positive and Senator Edward Johnson, chairman of the Senate Commerce Committee and a 'color now' advocate promptly demanded that the FCC clear the way for color before the public became saddled with black and white sets."

Goldmark: "From then on things happened fast."

Perhaps, but before we drop ourselves into this grand finale race to the finish, some observations from George Brown and his RCA cohorts who were not quite convinced Goldmark had "developed a new method of broadcasting color."

Brown: "CBS proclaimed they now had the secret of confining (color) to a single (6 megacycle width) television channel by means of new methods the details of which were not disclosed. We visited their transmissions, dissected what we saw and

scratched our heads. The results were 405 lines, 144 fields (48 per second per color or 24 frames per second) and this told us that the vertical resolution must be not more than 77% of a normal black and white picture (405 lines versus 525 lines) while the horizontal resolution could be no more than 55% of that of a black and white picture. We constructed a pair of field sequential receivers complete with whirling disks and moved one to a rented bedroom at the Washington Hotel in downtown Washington in order to monitor the broadcasts over CBS affiliate WTOP. Those in attendance agreed the color rendition quality was very good but the picture was fuzzy (lacking in detail - a direct result of the significantly reduced horizontal and vertical detail available). And we were bothered by a constant picture flicker since we were using a quite bright picture tube, brighter than CBS usually used in their demonstrations."

Yes, Brown was Goldmark's nemesis and it might be suggested that he was biased against everything CBS did. But history assures us of his technical integrity and while his bias may have been real, his technical correctness was almost always spot on. He reported what they found to RCA brass. Brown would observe, "We were facing skilful competition."

In January 1949, 51 TV stations were operating in 36 markets and Televiser Magazine reporting on RMA/RTMA TV set production claimed 1,200,000 TV sets were in the hands of the public. Moreover, new sets were going into homes at the profound rate of 140,000 per month. The FCC called for full scale demonstrations and then hearings to begin in September 1949 which would be the start of month 13 from the date the FCC froze all new station applications. Senator Johnson may have been an advocate of "color now" but his real advocacy was for 'TV now'. His home state, Colorado, had been "frozen out" of TV in 1948 and his constituents were daily berating his office demanding access to the video medium. He correctly saw a decision on color as holding up even black and white TV for Coloradians.

The color TV debacle was about to move into high gear and the final curtain was less than a year away. We'll give away the result up front because most already know it. CBS won against RCA (and weak third ran California firm, CTI).

The first public demonstrations involved a dual test shortly after the hearing opened on September 26 (1949). CBS, CTI and RCA were each required to demonstrate color TV on receivers of their own design from two

different sources. First, from a coaxial cable that linked New York City and Washington, and next, from a local TV station. The coaxial cable test was to answer, for the FCC's peace of mind, whether any of the three systems could be inter linked between cities using the AT&T coaxial cable. George Brown on this aspect of the tests.

"AT&T provided coaxial cables between New York and Washington as well as to other cities. These cables were designated L-1 and could transmit frequencies from 0.04 to 2.7 megacycles while signals above 2.7 megacycles were attenuated rather severely, even black and white pictures had a loss of detail. The FCC required that color pictures created by the three competitors generated in Washington be sent to New York City, turned around and returned to Washington for display. The CBS 405 line signals retained color information but the picture detail, already poor, was further degraded. But the RCA signals came through only in black and white, a fact triumphantly noted by CBS. We anticipated this because the RCA system had a color subcarrier at 3.8 megacycles and this was well into the higher loss region above the L-1's 2.7 megacycle upper frequency limit. We stoutly maintained that this was not a serious defect because AT&T was in the process of upgrading the L-1 cables with a newer, wider band system they called L-3 which would when completed solve our problem of inter city distribution."

Point one against RCA.

While CBS and RCA were the two combatants, a third firm known as CTI (Color Television, Inc.) from San Francisco was also an entrant. To keep the systems identifiable, the FCC was referring to them as follows. CBS - field sequential, CTI - line sequential, and RCA dot sequential.

The live broadcast tests were designed to illustrate the state of home reception using local stations WNBW (owned by NBC), and WTOP (a CBS affiliate owned by the Washington Post newspaper). When the FCC last visited color TV (March 1947) CBS was expecting to get the nod and did not. And because Sarnoff had promptly hired as a vice president of NBC then-FCC Chairman Charles Denny the perception that RCA "bought their way out" of the skirmish was often discussed within the trade. At that time, CBS and Goldmark in particular could not admit their system contained shortcomings which might have influenced the FCC's seven commissioners to vote "no" to the CBS petition. But there were flaws in the system of which four stood out. One was the requirement that all TV receivers

Drake R8 with VHF converter and indoor random wire antenna

Here is a weather radio logging for your new column.

162.500 KWN 43 Langdon ND 9-19 1506 UTC poor with storm warning for parts of ND and wx for rest of state. My first wx radio here from outside MB! tropo.

In the Oct. VUD, the two 6M hams I reported as tropo should have been Es.

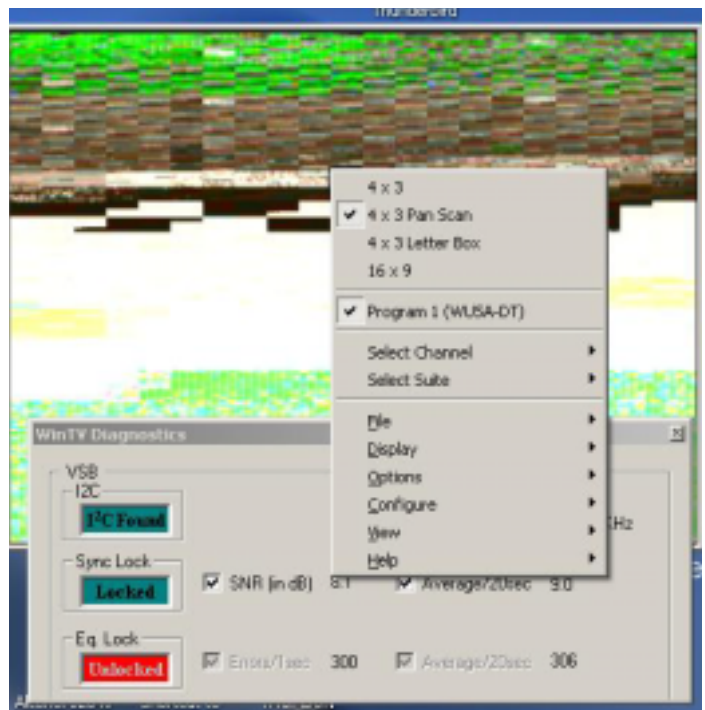

TELEVISION: THE TECHNOLOGY... CONTINUES FROM PAGE 40

equiped for color have a motor driven disc or narrow wheel which must be as a minimum 2.44 times the diameter of the TV screen it shrouded. The second was the "flicker problem" which was inherent in any field sequential system. The only solution here was to darken the room, reduce the contrast and brightness on the display and allow your eyes to adjust to the artificiality of sitting hunched over a tiny screen. Number three

was the requirement for a 12 megacycle channel width, impossible at VHF and therefore CBS had been led to not only urge the FCC to approve color but the opening of a little explored UHF TV band simultaneously. Finally, the matter of compatibility. When CBS transmitted a color program, the entire universe of black and white TV sets went dark (or displayed 16 gyrating miniature images that danced across the screen as if a chorus line).

Two DTV screenshots using the Win TV-D card. One is WFME DT 29, Newark, NJ. The other is WUSA-DT 32, Washington, DC, not locking, but showing an ID. Seen in CT.

AND ALONG COMES IBOC...

OH NO, Not Again!

Mike Bugaj on 12/31/04:

WHCN 105.9 Hartford, the River, has just turned on the IBOC. Gone are 105.7 and 106.1, although I did hear WROR-105.7 break through a few times this morning. Comment: This stinks.

Keith McGinnis:

As much as I hate IBOC it is possible to dx thru it on FM. Moderate to strong trop and good Es cut thru it. All is not lost. Just as (to) Jeff Lehmann or me.

Bob Smolarek:

You are so right Mike, this IBOC stinks! Sorry to hear you lost 105.7 and 106.1. An update down here, WSNI 104.5 turned it on, goodbye 104.7! I think once the Lehigh Valley's on 95.1, 96.1, and 100.7 get it I probably will pack it in, and just DX super openings like that summer eskip. Unless some technical person can come up with a solution, this hobby is dying.

Scott Fybush:

I beg to differ, somewhat.

I suspect that there were people bemoaning the "end of the hobby" when we moved from the 42-50 band upstairs to 88-108, and again when the first stations started running superpower, and then again when the flood of the little class As came on.

No, IBOC won't make things any easier. Yes, it will wipe out a lot of frequencies that many of us are accustomed to DX'ing on, especially those of us in or near major markets. But to my mind, it's just the latest of many challenges we all have to face as "non-priority" users of the broadcast spectrum. There will still be stations that don't adopt IBOC, and I'm far from convinced that the system will be enough of a success that it will still be around 10 or 15 years from now, period. (AM stereo, anyone?)

Some of us already DX under far less than favorable conditions - three class B FMs with very low antennas less than a mile away, in my case. When IBOC gets here, it will just be one more headache - but it could also be viewed as being one more challenge to overcome. And let's face it, when and if receivers show up out there, some of us will no doubt begin chasing IBOC DX, too.

The analogy I like to use is on the TV side: yes, the arrival of DTV wiped out a LOT of previously open channels (no more Scranton 28 or even Watertown 16 for me, for instance) - but it also created a slew of new, and to my mind very interesting, DX opportunities. I don't think IBOC FM will be anywhere even close when it comes to DX opportunity, but there's got to be some there. And it can't really be that much worse than the flood of translators that's doing just as much to choke up the band, can it?

Jacob Norlund:

The problem isn't that there isn't a solution...it's that nobody is deploying it. Our dumbed-down FCC thought that IBOC was the best approach to DAB in the US. Ummmm...NO! As if the FM dial in many markets is not crowded already! The European approach (giving DAB its own band) seems to be the best one. Unfortunately, the FCC is too thick-minded to notice. Suggest it to them and they'll probably cry out "but the spectrum's too crowded!". Have a scanner, FCC? Try parts of the 230 - 405 MHz air band for a start. Crowded? Not quite! Perhaps the best solution would be to carve out a 10 or 15 MHz segment of that band. Some military services do use that portion of frequencies, but since the entire range (or most of it) is allocated consistently, it might have been wisest to transmit DAB on frequencies there...and perhaps using an open (or at least semi-open) format. But no...we have to use that wonderful closed Ibiqity system (which you need a license from the corporation to use!), cuz open systems just ain't the FCC's way.

Eric Bueneman:

I wouldn't be surprised that 105.5 and 106.3 would be gone, too...and that 105.3 and 106.5 would suffer from interference.

I don't think so. IBOC, to tell you the honest truth, is an honest-to-goodness waste of spectrum space. On AM, it can waste up to 100 kHz of spectrum space. I've lost a good daytime/sunset channel in 860 in the St. Louis area. The loss of good DX channels would be just as bad if one station were to go

IBOC on FM in St. Louis. For example, with KFUO, I would definitely lose 98.9 and 99.3, but I would also lose two very good DX channels (98.7 and 99.5).

Jeff Lehmann:

It just seems to affect the first adjacents, at least on my T-80 with the good filters. I haven't seen a case where the second adjacents have been messed up, so you should be fine in that regard. I've now just about lost 11 clear frequencies because of this crap (because of 92.9,93.7, 96.9, 105.7, 106.7, and 107.9). It's an odd number, because 107.9only kills one. 2 more Boston stations have it (91.9 and 99.5) but those are weak enough here that they don't bother me too much.

As I've said before, why can't we be like Canada and the rest of the world and put this digital stuff in it's own band!

Eric Bueneman:

That's why IBOC should never be implemented. The AM and FM bands are simply not suited for digital radio...the NAB has no other choice but to accept more competition. We wouldn't have had this mess if the FCC approved Eureka 147, and forced the DoD to higher frequencies.

Doug Smith:

Unlike AM, IBOC-FM doesn't trash second-adjacents on any decent radio.. WQZQ-102.5 is one of my strongest locals; their IBOC certainly does trash 102.3 and 102.7, but it doesn't cause any problems for WBUZ-102.9or W271AB-102.1. (ironically, both of which are owned by the same company that owns WQZQ!)

WLAC-1510's IBOC, on the other hand, certainly does do a good job of clobbering 1490-1530. Luckily, so far only during the day.

Joe Fela:

A couple of years ago, I was told there were two reasons broadcasters wanted IBOC rather than DAB in its own band. The first is that where a separate DAB band was opened-up, it was largely ignored by the public. In short, an economic disaster. A certain WOR engineering head laughed at the fact that the DAB band in Europe received almost no public listenership (is that still the case?). I believe he also said the same for Canada. The 2nd reason is that supposedly the FCC refuses to allocate spectrum for a DAB band....the spectrum in question supposedly is reserved for military use. I think most of us believe that if broadcasters really wanted a DAB band, they would have it (what broadcasters want, broadcasters get!).

Jacob Norlund:

It's doing much better in England right now. Although in the past the rollout may have been a little pre-mature with radios too expensive and the like. Today, however, it wouldn't be difficult to make a relatively inexpensive DAB radio for ~300 MHz or L-Band (microwave, as used in Canada). The FCC and the DOD ought to discuss issues such as this and come to a compromise. I can't see them having use for 180MHz of continuous spectrum, if that's what it is.

Mark Hattam(UK):

UK DAB Allocation is 11B thru 12D of these DAB multiplex channels

Block MHz

10A 210.080	11C 220.352	13A 230.784
10B 211.792	11D 222.064	13B 232.496
10C 213.504	12A 223.936	13C 234.208
10D 215.216	12B 225.648	13D 235.920
11A 216.928	12C 227.360	
11B 218.640	12D 229.072	

I can sort of see why IBOC or digital on AM could be wanted ... better quality than AM.

But what's the advantage on FM?

Over here DAB audio is inferior to FM stereo due to the low bitrates used (low bitrate means more "choice" as they can squeeze more streams in on each multiplex).

Joe Fela:

The claim is that it is slightly better than normal FM. However, keep in mind that the IBOC channel can also be used in the future for non-entertainment uses (data streaming). With that in mind, I think IBOC is here forever, even if a DAB is established in the future (which I suspect will happen in time only because IBOC will not give listeners enough choices when compared to the satellite services).

Bob Cooper:

Reference 230-405 MHz. In 1946, the US Government established their own version of the FCC for military and government users called IRAC -Interdepartmental Radio Advisory Committee. The FCC is NOT allowed access to the spectrum you quote because it is IRAC territory. And surprise-surprise - IRAC is not answerable to ANYONE save the White House through the office of telecommunications. And you thought Doug's posting about WWV was a mindblower!

Doug Smith:

(RE: 10A 210.080 and 10B 211.792) This spectrum is used by TV channel 13; the 222MHz ham band; the "220MHz radio service"; and the bottom of that military band here in the U.S..

The Canadians are using spectrum around 1400MHz for DAB. It's my understanding the same band is in use in a number of European countries. It was officially considered not acceptable for DAB use in the States because of some kind of flight test allocation that couldn't be moved. (but I read somewhere in the last few weeks where that allocation has been quietly withdrawn for lack of use...)

Unofficially I strongly suspect the reason was not technical.

I think the 220MHz spectrum is probably more suitable for DAB broadcasts, but with the DTV transition I don't think any scheme that involves reallocating a high-band VHF TV channel will work.

Doug Smith:

According to <http://www.wohnort.demon.co.uk/DAB/>, thirty countries use DAB allotments in the 220MHz vicinity. Ten use L-band spectrum between 1452 and 1492MHz. Some countries appear on both lists. Poland experimented with Eureka DAB within the regular 88-108MHz band but found it didn't co-exist with analog very well. Japan uses the 220MHz spectrum but an incompatible system called "ISDB-T".

According to <http://www.fcc.gov/oet/info/database/spectrum/spinvtbl.pdf> (you may also want to read <http://www.fcc.gov/oet/info/database/spectrum/spinvdoc.pdf>) this band is allocated to government aeronautical telemetering in the United States. If I read the table properly there are 275 transmitters authorized for this band.

IBOC (HD RADIO) NEWS

CLEAR CHANNEL RADIO today announced that 65 of its radio stations are broadcasting via digital signal utilizing iBIQUITY's HD RADIO technology. Earlier this year, CLEAR CHANNEL announced its Advanced Technology Initiative, which includes an aggressive conversion to HD RADIO on 1000 of its stations (95% of the company's total stations) over the next 3 years.

iBIQUITY said at the CONSUMER ELECTRONICS SHOW that it has deals to convert another 2,000 terrestrial radio stations to HD RADIO, including stations owned by ABC/DISNEY, BEASLEY, COX, EMMIS, and VIACOM as well as CLEAR CHANNEL. REGENT issued a release saying it, too, is participating in the conversion, and iBIQUITY says it expects about 15 HD RADIO receivers to be on the market by the end of 2005, including the first tabletop versions (there are presently only three HD RADIO receivers on the market)."

Two-Thousand New Radio Stations Set To Air Digital Broadcasts

(Columbia, MD) -- A Columbia, Maryland company has signed a deal with 21 of the nation's leading radio groups to accelerate the rollout of its digital broadcasting technology. iBiquity Digital says that in addition to improving audio content, HD Radio allows stations to broadcast a wireless data feed to receivers that might include traffic or weather information, in addition to song and artist information. Approximately 500 AM and FM radio stations have begun the transition or are carrying the HD Radio signal. The new deal adds another two thousand commercial stations that will convert to the digital format. The Corporation for Public Broadcasting will soon offer a total of 309 digital stations.

IN SEARCH OF THE ULTIMATE DTV SET TOP BOX

Is There Anything New Under the Sun for 2005?

Posts and information from the WTFDA list.

The original post asked the question "If you really want to get the members interested in the DTV Dx, have the members that Dx DTV report what brand name decoder card they use. There is so many different ones to choose from, how are we going to know what one to get? I just got another pc in October and am looking into getting another DTV decoder card. Before I put my money down, I would like to know which one I should get. I already have the Win-TV-D, what about the Win-TV-HD? I also have the Sony HD-200 & HD-300 direct TV receivers that do DTV. I hear & read about these next generation design receivers & it adds to the need to know which one to shoot for (to buy)."

First reply from Glen Hale "I have had experience with several. Here are the models I've used at one time or another..."

- Samsung SIRT-150
- Hughes HIRD-E86 (DirecTV)
- Samsung SIRTS-160 (DirecTV)
- Motorola HDT-100
- LG LST-3100A
- Zenith HDV420
- Zenith Sat HD520 (DirecTV)
- WinTV-D
- ATI HDTV Wonder
- Sylvania SRZ3000

For sheer reception capability, I think the Sylvania is the best I have used. In general, it locks onto and holds onto DTV signals better than any of the others. However, it isn't the most "DX friendly" DTV receiver. It does allow you to sit on a channel and wait for a signal to come in, but you won't know anything is there unless it locks. It's no longer made, but they can be found on eBay for under \$150. The LG is probably the most "DX friendly" of the non-PC receivers. It will allow you to display a signal meter on any channel at any time. It's receive performance is pretty good, but I had trouble with it overloading in the presence of strong signals. Of the two PC-based receivers I've used, I prefer the WinTV-D. It has a nice diagnostic screen aiding with DT reception, but its reception capabilities are not up to the newer STB's with the latest chips. By comparison, the ATI is slow, buggy and very DX unfriendly.

A 5th generation receiver should be on the market sometime this year, possibly in a model sold at Wal-Mart under the "US Digital" moniker. They currently sell these boxes, but they have 4th generation chips. The 5th generation chip is supposed to perform much better in a high-multipath environment, but no one really knows if it will do much to improve weak signal reception.

Several people at AVS Forum rave about the LG LST-4200. Most there regard it as the

best currently on the market. Samsung and Motorola both have current models that I've seen at Circuit City.

Bob Cooper comments "I saw a posting from LG over the New Year's period stating they would NOT be releasing version 5 of their processor in a stand alone box "at this time." My interpretation is they are either short of chips and cannot support boxes, or think they can get a bigger dollar from selling the latest version chips directly to the TV set makers."

Steve Rich adds "I currently own the old RCA DTC-100, the LG LST-3100A and the WinTV-D. Overall, the LG is the best DTV DXing receiver I own and as Glen mentioned, it the most "DX friendly."

FWIW, a few weeks ago I posted these comments to a few area DXers regarding tropo reception from Nashville, TN stations @ 257-272 miles and Cincinnati, OH stations @ 103 miles.....

Going back to the tropo conditions Mon. evening and Tue. morning, I'm still somewhat baffled by the results I get between my three DTV receivers. The LG was the only unit to decode the PSIP and the video from WZTV-DT. Meanwhile, during the peak of the signal from WKRN-DT, the RCA registered a signal reading high of 50, where it needs at least 31-32 to decode. In fact, the RCA was able to display a fairly solid picture for almost 90 seconds. During the same time the WinTV-D was able to decode the call letters and to display a couple of very weak "green" video shots while the LG displayed absolutely nothing! The LG never did decode WKRN-DT, not even the PSIP info. None of the three units ever decoded the Nashville DTV on ch. 36. WTVQ-36 was in and out most of the evening so that might have been a factor with that one.

Then yesterday morning I noticed that the RCA locked in on WKRC-DT as soon as I punched in ch. 31 while it took the LG another minute or two to decode it. A few minutes later I noticed that the LG locked in immediately on WLWT-DT while the RCA was rather slow in locking in on this station. The WinTV-D also found these stations yesterday morning but was way behind the other two receivers and reception was very sporadic.

Just some observations as we all continue to locate the ultimate DTV receiver!!"

Karl Zuk said "I bought a Sony Wega 960 for someone over the holidays. Half of Sony's HDTV line now has ATSC tuners incorporated into the sets, so STBs maybe a thing of the past already. It's about time HD sets came with HD tuners."

Dave Pomeroy adds "The set top boxes are definitely hard to find around here.

(Topeka/Kansas City area) Stores with HD monitors for sale don't even have them. Some even suggest you buy the monitor from them and the STB from someplace like Best Buy which in Topeka at least doesn't have them either. They appear to be a thing of the past, but if the "transition" ever takes place there should be some demand. We will have to buy at least two of them (sure hope the price comes down) and even more if we want to continue to use our small portable sets. Sure can't pay \$200-\$300 for each one.

I have been using the Win TV-D for 5 years now. Overall, I'm fairly pleased with it and find it "DX-friendly." We also have a Samsung 26" HDTV set that I have captured some DX on, but it really gets confusing when it maps a DTV channel back to their analog channel number. Some channels are blocked when the thing remembers a station and won't decode another station on the same channel during an opening. Very frustrating. However, it appears to be as sensitive as the Win TV-D. I have tried a couple of other STBs--a Samsung and the LG 3100A. The 3100A was better than the Samsung, but on one occasion I was able to receive a DTV station through the WIN TV-D and not the LP. I sold the LP and am waiting for an ideal STV box.

For non-DX viewing I really like the Samsung set. My nine-year-old daughter has mastered and really enjoys some of the PBS Kids programming on local KTWU-DT 23 multicast. My wife has to ask me or our daughter for help if she wants to watch a program on the DTV set. We don't have cable or satellite and visitors can't believe how good

the signal looks. Of course, most of them are comparing it to the cable signal they are getting at home which is usually somewhat lacking in quality.

My most distant reception has been on the Win TV-D with Houston, TX at over 600 miles. I like the way a signal is frozen with PSIP if the signal decodes at least once. Several IDs have been "captured" overnight that way while I slept or was at work before I retired. And finally Gerard Westerberg closes with "I've had decent results with the WinTV-D card (130 DTV logs in 19 states so far). As others have mentioned, the WinTV-D chip set is probably a little behind those of the newer set top boxes. During some comparisons with various STBs, the WinTV-D was able to lock on and decode a weak signal about as well as any of the STBs tested. It performed MUCH better than any of the Samsung STBs I tested, but not quite as well as the Zenith / LG STBs. The newer chipset STBs are definitely better than the WinTV-D at holding their lock and displaying a good picture through difficult and changing conditions.

Analog NTSC performance on the WinTV-D is fair at best, probably comparable to most cheap VCRs.

Where the WinTV-D really shines is in its "DX Friendliness". It is extremely easy to operate, does no annoying remapping, and effortlessly produces nice screen captures. To me, the WinTV-D's DX friendliness and functionality outweighs any benefit I've seen so far from the various "more advanced" STBs I've been able to test. I'm awaiting LG's fifth generation chipset before I try yet another STB.
